Research field and scientific interests	<p>My research is mostly focused on the statistical analysis of complex data with spatial dependence, with particular reference to functional data, compositional data and data in Riemannian manifolds. In the last years, I have been working on introducing and exploring <i>Object Oriented Spatial Statistics</i> (O2S2) as an original area of statistics addressing the problem of characterizing sets of spatially dependent, high- or infinite-dimensional data, possibly featured by a heterogeneous spatial structure (e.g., grouping in the data, non-stationarity). Recently, I have also considered object-oriented Kriging for multi-fidelity modeling and statistical meta-modeling. I am currently working on O2S2 for processes taking place in complex spatial domains, such as textured domains, networks or high-dimensional spaces, with application to environmental and industrial data. Further scientific interests include the field of statistical process control in the presence of complex responses, such as misaligned functional data or image data, in the context of emerging production technologies, such as additive manufacturing. <i>h-index (Scopus): 10</i></p>
